STORE AT 4°C away from light. DO NOT FREEZE

Description

The 50 nm gold nanoparticles are uniform quasi-spherical gold nanoparticles with a mean diameter of twenty five nanometers capped with citrate. These nanoparticles present unique physic-chemical properties (i.e. optical, catalytic, electrochemical activity, etc.). Citrate gold nanoparticles are excellent candidates to be functionalized since a wide range of molecules can be tethered onto the AuNP surface by means of a thiol (SH) group displacing adsorbed citrate anions. Once functionalized, they can be employed as platforms for many applications such as target-specific drug delivery, sensors, lateral flow tests, imaging probes for dark-field microscopy, flow cytometry, cancer photothermal therapy, catalysis, and optoelectronic. They can be also conjugated with distinct molecules and/or other micro/nanostructures to generate new biosensors, therapeutics, etc. The optical and electronic properties of gold nanoparticles are tuneable by changing their size, shape, surface chemistry or even their aggregation state.
